

Trapping Keypresses with When characterInput and Inkey\$

May 15, 2006 -

[JanetTerra](#) May 15, 2006

Liberty BASIC can trap keypresses in a graphicbox and a graphics window. You can then identify the key pressed for navigating throughout your program. The command is **When characterInput** and the special variable is **Inkey\$**. The graphicbox (or graphics window) must have focus in order to sense the keypress.

```
Print #1, "When characterInput [Keypress]"
Print #1, "Setfocus"
```

The [Keypress] event handler uses Inkey\$ to hold the detected character.

```
[Keypress]
key$ = Inkey$
Print key$
```

Ascii Values

When the character of the key is identified, the numerical value of that key can be obtained using the Ascii command. Using the Ascii value can often be easier to use for comparisons than the character itself. Every character has a different Ascii value.

```
Print Asc("A") ' Ascii value = 65 : A-Z = 65 - 90
Print Asc("f") ' Ascii value = 102 : a-z = 97 - 122
Print Asc("?") ' Ascii value = 63
```

Virtual Keys

The graphical representation of the "A" key is "A." Not all keys have graphical representations. Examples include the

- The **TAB** key
- The **CONTROL** key
- The **ALT** (menu) key
- The **Number Pad** keys
- The **Home** key
- The **End** key

- The **Function** keys (F1-F16)

Commonly, the Arrow keys and the Enter key are of most importance. Arrow keys can either be trapped by their Ascii values (37, 38, 39 and 40), or their corresponding `_VK_Keys`

- `_VK_LEFT`
- `_VK_UP`
- `_VK_RGHT`
- `_VK_DOWN`

`_VK_Keys` are especially useful for those keypresses that are actually composed of two characters.

```
' Enter key has been pressed and trapped with When character Input
key$ = Inkey$
For i = 1 to 2
    Print Mid$(key$, i, 1) ' Prints 0, then 13
Next i
```

To ignore the leading special character, use

```
key$ = Right$(Inkey$, 1)
```

With keys that have graphical representations, the value of the `_VK_Key` is the same as the `Asc(character$)`. Since the `Right$(character$, 1)` of a one character string is the `character$`, then the same command can be used regardless of whether the trapped key is one or two characters in length.

```
character$ = "a"
Print character$ ' Prints a
Print Right$(character$, 1) ' Also prints a
```

This demo uses the command *When characterInput* and the special variable *Inkey\$* to sense and trap a keypress. `Right$(Inkey$, 1)` is stored in `key$`, and `key$` is examined for relevant (or allowed) keypresses. This comparison is made using *Select Case* and *If Then Else End If* statements.

```
WindowWidth = 600
WindowHeight = 400
UpperLeftX = Int((DisplayWidth - WindowWidth)/2)
UpperLeftY = Int((DisplayHeight - WindowHeight)/2)

Open "Trapping Keypresses with Inkey$" for Graphics as #1
#1, "Trapclose [EndKeypresses]"
```

```
#1 "Font Verdana 20 Bold"
xPos = 0 ' Starting x Coordinate
yPos = 30
' Starting y Coordinate, y is bottom left of character, not top left
#1 "When characterInput [keypress]"
#1 "Color Darkblue; Backcolor White"
#1 "Down; Setfocus"

Wait
```

```
[keypress]
' Some keypresses send 2 characters, so only read rightmost
key$ = Right$(Inkey$, 1)
key = Asc(key$)
dir = 0: keypress = 0
Select Case
    Case key = 37 ' Left Arrow
        dir = 1
    Case key = 38 ' Up Arrow
        dir = 2
    Case key = 39 ' Right Arrow
        dir = 3
    Case key = 40 ' Down Arrow
        dir = 4
    Case (key > 64) and (key < 91) ' A - Z
        keypress = key ' Asc("A") - Asc("Z")
    Case (key > 96) and (key < 123) ' a - z
        keypress = key - 32 ' Asc("A") - Asc("Z")
    Case (key > 47) and (key < 58)
        keypress = key
    Case key = 13
        keypress = 13
End Select
If dir > 0 Then ' Arrow Key
    Select Case dir
        Case 1 ' Move Left
            xPos = xPos - 30
            If xPos < 0 Then
                xPos = 0
            End If
        Case 2 ' Move Up
            yPos = yPos - 30
            If yPos < 30 Then
                yPos = 30
            End If
        Case 3 ' Move Right
```

```
xPos = xPos + 30
If xPos > 570 Then
    xPos = 570
End If
Case 4 ' Move Down
    yPos = yPos + 30
    If yPos > 360 Then
        yPos = 360
    End If
End Select
End If
If keypress > 47 Then ' Letter or Number Key
    #1 "Place ";xPos;" ";yPos
    #1 "\";Chr$(keypress)
End If
If keypress = 13 Then ' Enter Key
    Confirm "Do you want to quit?";quit$
    If quit$ = "yes" Then [EndKeypresses]
End If
' Any keypresses not captured in above Select Cases and If Thens are i
gnored
Wait

[EndKeypresses]
Close #1
End
```

For a list of Windows Virtual-Key Codes, view the [MSDN Library](#). The values will need to be converted from hexademical to decimal for Liberty BASIC use.

Sub Event Handlers

If you prefer to use sub event handlers rather than branch label event handlers, you must include receiving variables for the window handle and the character variable.

```
Sub keypressDetected handle$, char$
```

This is the same demo as above, but with sub event handlers. Because variables cannot be seen "inside a sub," xPos and yPos must be declared as **Global** in the beginning of the code.

```
WindowWidth = 600
WindowHeight = 400
```

```
UpperLeftX = Int((DisplayWidth - WindowWidth)/2)
UpperLeftY = Int((DisplayHeight - WindowHeight)/2)

Open "Trapping Keypresses with Sub Events" for Graphics as #1
#1 "Trapclose EndKeypresses"
#1 "Font Verdana 20 Bold"
xPos = 0 ' Starting x Coordinate
yPos = 30
' Starting y Coordinate, y is bottom left of character, not top left
Global xPos, yPos
#1 "When characterInput keypressDetected"
#1 "Color Darkblue; Backcolor White"
#1 "Down; Setfocus"

Wait

Sub keypressDetected handle$, char$
' Some keypresses send 2 characters, so only read rightmost
key$ = Right$(char$, 1)
key = Asc(key$)
dir = 0: keypress = 0

        If quit$ = "yes" Then [EndKeypresses]
    End If
' Any keypresses not captured in above Select Cases and If Thens are i
gnored
End Sub

Sub EndKeypresses handle$
    Close #1
    End
End Sub
```

Trapping Mouse Events

The When command can also be used to track mouse events, those events being button states and mouse movement. These commands are also When commands. An example of a mouse When command is

```
Print #main.g, "When leftButtonUp [LeftButtonClicked]"
```

For more information concerning the mouse When commands, see [Trapping Mouse Actions and the When Commands](#).
